

Proofpoint AntiSpam

Powerful email security to protect your staff and business.

What is Proofpoint?

Email Security Proofpoint provides comprehensive, enterprise protection to your staff and business against the basic to the most serious forms of malware, spam, spoofing, phishing and email-based viruses. Proofpoint scans over 2BN emails daily and actively protects over 20M mailboxes.

Whether on-premise or hosted alongside your business email, Proofpoint provides the right tools, powerful protection with easy management and a clear overview of the status of email protection. IT managers and businesses can have confidence that they are well protected.

Proofpoint automatically scans and quarantines emails which are deemed to be suspicious. Staff are provided with a quarantine digest email each day from Proofpoint servers, where they can review emails, release accidentally quarantined emails and ask for assistance from IT if they are unsure. This process ensures that the business is not losing any legitimate emails.

How it works

ASL deploys the service and rolls it out across your email devices.

Standard policies will be automatically enabled (fully customisable) to protect mailboxes.

A daily digest of quarantined emails will be sent to each staff member to ensure legitimate emails are not missed.
